DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

5

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

10

15

Claim 1 is rejected under 35 U.S.C. 103(a) as being unpatentable over applicant's admitted prior art (AAPA) in view of Ziperovich (U.S. Patent 5,886,842).

Regarding claim 1, AAPA discloses "DC-offset eliminating method for a receiving circuit of a receiver which receives signals comprising a plurality of frames continuously sent to the receiving circuit, each of the frames has a predetermined frame structure and only at the head of each frame a preamble portion is added, comprising the steps of:

calculating a DC-offset component depending upon the received signals (page 3, lines 3-5 of the specification);

20

25

subtracting said DC-offset component from the received signals (page 3, lines 3-8 of the specification); and

performing a DC-offset eliminating operation based on the subtracted result (page 3, lines 3-8 of the specification),

wherein in said DC-offset eliminating operation, a DC offset follow-up speed is set for reducing a follow-up speed (page 3, lines 11-24 of the specification)..."

Application/Control Number: 09/759,219

Art Unit: 2661

Page 3

However, AAPA lacks what Ziperovich discloses, that is the follow-up speed is calculated "...with respect to the DC offset when said preamble portion is being received, regardless of a time when a continuous reception is performed in which all of said frames are received to recognize the timing of the frame number to be received or a time when an intermittent reception is executed in which only a frame destined for said receiver itself is received (col. 6, lines 9-21)."

It would have been obvious to one with ordinary skill in the art at the time of invention to include the "follow-up speed" changed "with respect to the DC offset when said preamble portion is being received" with the rest of the method for the purpose of finding an appropriate DC correction value prior to the reading of the user data (Ziperovich, col. 6, lines 21-24). The motivation being that knowing the appropriate correction value prior to the reading of the user data allows all of the data to be properly decoded because the "learning curve" to find the offset happened during the preamble not the data.

15

10

5

Allowable Subject Matter

Claims 2 and 3 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

20

The following is a statement of reasons for the indication of allowable subject matter: Claims 4 and 5 are allowable because the prior art fails to teach, in combination with other claim limitations, "an AND circuit for performing logical AND operation on said

received frame signal input from said control circuit and said frame-continuation detection signal input from said signal-end detecting circuit, characterized in that: said DC-offset eliminating circuit selects any one of said coefficients H and L depending upon an output from said AND circuit."
